Conventions

The following conventions are used through this guide:

- **Bold font** is used for what you type on the command line and for the screen output.
- In commands, braces `{ }` around an item indicate that it must be specified.
- In commands, square brackets `[]` around an item indicate that it is optional.
- In commands, braces with pipes inside `{ | | | }` indicate you must specify one option among multiple items.
- In commands, square brackets with pipes inside `[| | |]` indicate you can either specify one option or more options.
- Whenever you type a parameter with a space, it should be enclosed with double quotation marks `" "`.

Introduction to the HighPoint Command Line Interface

The HighPoint CLI (Command Line Interface) is a command line utility that configures and manages HighPoint RAID controllers via a command line. It is ideal for systems where the browser-based RAID Management utility cannot be used.

Supported Operation Systems and Adapters

The current CLI release supports Windows and Linux operating systems.

CLI Command Reference

This chapter discusses the various HighPoint CLI commands: Query, Create, Delete, OCE/ORLM, Rebuild, Verify, Unplug, Switch, Lscard, Rescan, Init, Events, Mail, Task, Set, Clear, Help and Exit.

Warning:

Operations under the Create/Delete commands may destroy data stored in the disks, and the lost data can never be recovered. So you should take special care when executing these commands. The CLI utility will not prompt before each operation is committed.

Query Commands

Syntax

- query controllers
- query devices
- query devices {device_id}
- query arrays
- query arrays {array_id}

query controllers

This command reports controller information.

Example

```
HPT CLI> query controllers
```

Typical output:

```
HPT CLI > query controllers
ID          Channel      Name
-----
1           8            RocketRAID 4520 SAS Controller
-----
IOP Model   88RC9580 (9580B2)
$DRAM Size  512M
Battery Installed      No
Firmware Version      v1.4.74.22
Battery MotherBoard Status  Not installed
-----
HPT CLI > _
```

query devices

This command presents status of all the physical devices to the controllers. It provides a list of device ID, capacity, model number, status and array attributes. Each device's status will be listed as one of the following: NORMAL, DISABLED, SPARE, RAID and BOOT.

Attributes

ID:

A device ID is a string used to represent a disk. It is in the format "controller/port" for SATA controllers, and "controller/channel/device" for PATA controllers. E.g. 1/2 represents the disk on controller 1 port 2; 1/2/1 represents the disk on controller 1 channel 2 master disk; 1/2/2 represents the disk on controller 1 channel 2 slave disk.

Capacity:

The capacity of the disk in GB.

MaxFree:

The Maximum sequence free space on a disk which can be used by creating array.

TotalFree:

The sum of all the free space on a disk which can be used by creating array.

Hard Disk Status:

NORMAL: The disk's status is normal.

DISABLED: The disk's cannot be use. (May be disk failure or removed)

RAID: The disk is a member of some RAID.

SPARE: It is a spare disk

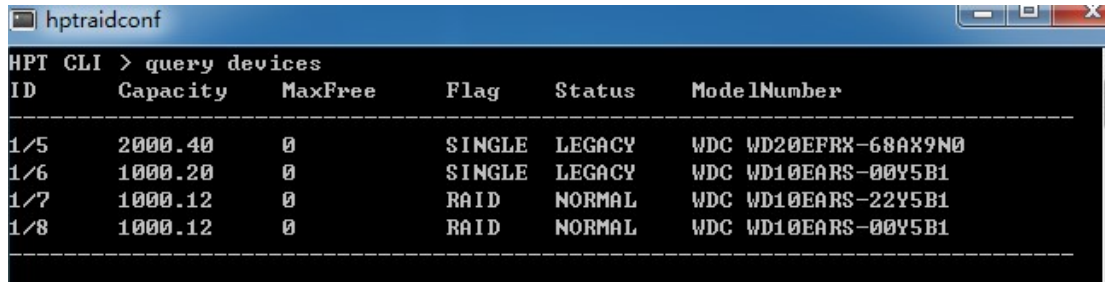

ModelNumber:

The disk's model number.

Example

HPT CLI> query devices

Typical output:

```
HPT CLI > query devices
ID      Capacity  MaxFree  Flag    Status  ModelNumber
-----
1/5     2000.40   0        SINGLE  LEGACY  WDC WD20EFRX-68AX9N0
1/6     1000.20   0        SINGLE  LEGACY  WDC WD10EARS-00Y5B1
1/7     1000.12   0        RAID    NORMAL  WDC WD10EARS-22Y5B1
1/8     1000.12   0        RAID    NORMAL  WDC WD10EARS-00Y5B1
```

query devices {device_id}

This command presents information for the specified device.

Attributes

Serial Number:

Disk Serial Number

Read Ahead/Write Cache/TCQ/NCQ Status:

Disk's Read Ahead/Write Cache/TCQ/NCQ status could be enabled/disabled/--(not support)

S.M.A.R.T Attributes:

S.M.A.R.T Attributes detailed information reported by hard disk

Example

SATA DISK:

HPT CLI> query devices 1/5

```

HPT CLI > query devices 1/5
Mode Number:      WDC WD20EFRX-68AX9N0
Serial Number:    WD-WMC300032432

```

query arrays

This command lists information for all configured arrays. It will list each array's ID, capacity, RAID level, and status information.

Note: An array ID is generally represented by number or set of numbers. For RAID1/0 arrays; each sub-array will be represented by an ID in the format "1-1", "1-2". An array ID is used in the command line where an array needs to be specified.

Attributes**Type:**

The array's type. (RAID0, RAID1, RAID5, RAID6, JBOD, RAID10, RAID50)

Status:

- DISABLED: Array is disabled.
- EXP/IMG: Array is expanding or migrating.
- REBUILDING: Array is being rebuilt
- VERIFYING: Array is verifying
- NEED EXP/IMG: Expanding/Migrating is not complete
- INIT(F) Initialize array using Foreground mode
- INIT(B) Initialize array using Background mode
- UNINITIALIZED Array is not initialized
- CRITICAL Array is degraded status (no data redundancy)
- NORMAL Array status is normal

Block:

Array Block size

Sector:

Bytes per sector

Cache:

Array Cache Policy

- WT: Write Through
- WB: Write Back
- NONE: No Cache policy enabled

Example

HPT CLI> query arrays

Typical output:

```
HPT CLI > query arrays
ID      Capacity<GB>  Type      Status      Block  Sector  Cache      Name
-----
1       1000.12      RAID1     REBUILDING  --     512B    NONE      RAID_1_0
```

query arrays {array_id}

This command will present information of each disk of a specified array.

Attributes

Progress :

The progress of array's tasks (verifying, rebuilding, initializing, EXP/MIG)

Example

```
HPT CLI> query arrays 1
```

Typical output:

```
HPT CLI > query arrays 1
ID:          1                Name:          RAID_1_0
Type:        RAID1           Status:        REBUILDING
Capacity(GB): 1000.12        BlockSize:    --
SectorSize:  512B           CachePolicy:  NONE
Progress:    57.80%

ID      Capacity  MaxFree  Flag   Status  ModelNumber
-----
1/8     1000.12    0        NORMAL CRITICAL WDC WD10EARS-00V5B1
1/7     1000.12    0        NORMAL RAID    WDC WD10EARS-22Y5B1
-----
```

Init Commands

You can use init commands to initialize disks or arrays. **A drive must be initialized first before being used to create arrays.**

Syntax

- init {device_id}
- init {array_id} {start|stop}

init {device_id}

This command initialize a disk for first use or a legacy disk on the controller.

Example

```
HPT CLI> init 1/3
```

This command instructs the controller to initialize the disk on controller 1 channel 3. All data on the disk will be destroyed.

Init {array_id} {start|stop}

This command starts/stops initialization process on a redundant array.

Example

```
HPT CLI> init 1 stop
```

This command instructs the controller to stop initialization process on array 1. You can continue the initialization at a later time.

Create Command

This command allows you to create a new RAID array, or add a spare disk, or expand/migrate an existing array. **A drive must be initialized first before being used to create arrays.**

Syntax

```
create {RAID0|RAID1|RAID10| RAID5|RAID6|RAID50|JBOD|spare}  
      [create-options]
```

Parameters

You can specify one or more create options for this command, separated by space. The options can be typed in any order.

You can specify one or more create options for this command, separated by space. The options can be typed in any order.

disks= specifies member disks which will compose a new array, e.g. disks=1/1,1/2, disks=*. The character * means all available drives.

NOTE:When you enter a complete command with parameters disks=* at the shell prompt,the correct writing is disks="*".

For example:

```
hptraidconf -u RAID -p hpt create RAID0 disks="*".
```

init= specifies initialization option (foreground, background, quickinit, keepdata). The default option is create-only. The create-only option is applicable for all the RAID types, which is to create an array without any initialization process. Initialization is needed for redundant arrays to provide data redundancy.

foreground : Initialize array using foreground mode. This is the recommended method when creating redundant RAID arrays.

background : Initialize array using background mode. The array is accessible during array initialization.

quickinit : Do a quick init.

keepdata : Create RAID array but keep existing data on RAID array. This option should be selected when trying to recover a RAID array.

name= specifies the name for the array being created.

If the option is omitted, the utility will assign a default name for the array.

src= specifies an existing array to be expanded/migrated. All data on the source array will be redistributed online to the target array. If this parameter is omitted, a new array is created.

capacity= specifies the capacity, in size of MB, for the target array. Maximum capacity is default.

bs= specifies the block size, in KB, for the target array. This option is only valid for striped RAID levels. 64KB is default.

sector= specifies the logical sector size, in B/KB, for the target array. This option is only valid for striped RAID levels. 512 Bytes is default.

matrix=n*m
(RAID50 only) specifies the number of RAID5's members (n) and the number of RAID0's members (m).

cp=
Cache policy options.
WB: write back.
WT: write through.
NONE: none cache policy.

Examples

- HPT CLI> create RAID0 name=myraid0 disks=1/3,1/4

This command instructs the system to create an RAID 0 array using the disks attached to controller 1 channels 3 and 4, and name it **myraid0**.

- HPT CLI> create RAID5 disks=* src=1

This command instructs the controller to expand an existing array using all the available disks to a **RAID5** array.

- **HPT CLI> create spare disks=1/4**

This command indicates that you will set the disk on controller 1 channel 4 to be a spare disk.

Delete Command

This command allows you to delete an existing RAID array or remove a spare disk. After deletion, the original array and all data on it will be lost. All the member disks will be listed as available single disks.

Syntax

```
delete {array_or_spare_ID}
```

Examples

- **HPT CLI> delete 1/3**

This command indicates to remove the spare disk on controller 1 channel 3.

- **HPT CLI> delete 1**

This command indicates to delete the array whose id is “1”. You can query the array ID before the deletion.

Unplug Command

This command allows you to remove an array or disk from a running system without shutting down.

Syntax

```
unplug {array_id or device_id}
```

Example

```
HPT CLI> unplug 1
```

This command instructs the controller to disconnect the array “1” and then you can disconnect the drives safely.

Rebuild Commands

You can use rebuild commands to rebuild a RAID1, RAID1/0 or RAID5 array when it is critical or broken.

Syntax

- **rebuild {array_id} {device_id}**
- **rebuild {array_id} {start|stop}**

rebuild {array_id} {device_id}

This command allows you to add the specified disk to a broken array and rebuild it.

Example

```
HPT CLI> rebuild 1 1/3
```

This command instructs the controller to add the disk “1/3” to rebuild the array “1”. You can use the query commands first to verify the device ID and the array ID information before the rebuild command.

Rebuild {array_id} {start|stop}

This command allows you to start or stop the rebuilding process on the specified array. After you stopped a rebuilding process, you can resume it at a later time by the rebuild start command.

Examples

- HPT CLI> rebuild 1 start

This command starts the rebuilding process on the array “1”.

- HPT CLI> rebuild 1 stop

This command stops the rebuilding process on the array “1”.

Verify Command

Syntax

- verify {array_id} {start|stop}

This command starts or stops the verify process on the specified array.

Examples

- HPT CLI> verify 1 start

This command starts to verify the array “1”.

- HPT CLI> verify 1 stop

This command stops the verify process on the array “1”.

OCE/ORLM Command

Syntax

- OCE/ORLM {array_id} {start|stop}

This command starts or stops the **Online Capacity Expand/ Online RAID Level Migration** process on the specified array.

Examples

- HPT CLI> OCE/ORLM 1 stop

This command stops OCE/ORLM process on array “1”. You can resume the process at later time.

Rescan Command

This command will rescan all of the physical devices attached to the RAID controller.

Syntax

```
rescan
```

Example

```
HPT CLI> rescan
```

Lscard Commands

The lscard command is used to list multi RAID controllers.

Syntax

```
lscard
```

Example

```
HPT CLI> lscard
```

Typical output:

```
HPT CLI > lscard
CARD_ID          NAME                               ACTIVED
-----
0                Controller(1): RR272x_1x           Inactive
1                Controller(2): RR4520              Active
```

Switch Commands

The switch command is used to switch active card in multi RAID controllers.

Syntax

```
switch {card_id}
```

Example

HPT CLI> switch 0

Typical output:

```
HPT CLI > lscard
CARD_ID      NAME                                     ACTIVED
-----
0            Controller(1): RR272x_1x                Inactive
1            Controller(2): RR4520                    Active
HPT CLI > switch 0

HPT CLI > lscard
CARD_ID      NAME                                     ACTIVED
-----
0            Controller(1): RR272x_1x                Active
1            Controller(2): RR4520                    Inactive
HPT CLI > _
```

Events Commands

The CLI system will automatically record three types of events: Information (shortened to “Inf”), Warning (shortened to “War”), and Error (shortened to “Err”) on the screen output. These commands allow you to query, save, or clear the logged events.

Syntax

- events
- events clear
- events save {file_name}

events

This command will display a list of all the logged events.

Example

HPT CLI> events

Typical output:

```
HPT CLI > events
1 Inf [11/21/2013 14:44:28]          Array 'RAID_1_0' initializing (background) started.

2 Mar [11/21/2013 14:44:28]          Plugging device detected.<'SEAGATE ST3146955SS-3LN5Y1G3' at Controller1-Channel6>

3 Mar [11/21/2013 14:44:24]          Plugging device detected.<'SEAGATE ST3146955SS-3LN5XKZG' at Controller1-Channel5>

4 Mar [11/21/2013 14:44:24]          Plugging device detected.<'SEAGATE ST3146955SS-3LN461FK' at Controller1-Channel7>
```

Events clear

This command will clear all the logged events.

Example

```
HPT CLI> events clear
```

Events save {file_name}

This command will save all the logged events as a plain text file.

Example

```
HPT CLI> events save j:/raidlog.txt
```

This command will save all the events to `j:/raidlog.txt`.

Mail Commands

Syntax

- mail recipient
- mail recipient add {recipient_name} {mail_address} [Inf|War|Err]
- mail recipient delete {recipient_name}
- mail recipient test {recipient_name}
- mail recipient set {recipient_name} {Inf|War|Err}
- mail server
- mail server set {server_address} {port} { status } {from_address} [username] [password]
- mail server set {a|p|s|m|u|t} {value}

mail recipient

--- List all the mail recipients

Example

```
HPT CLI> mail recipient
```

Typical output:

```
HPT CLI > mail recipient
ID   Name      Mail Address      Notify Types
-----
1    RAID      test@somecompany.com  Information Warning Error
```

Mail recipient add {recipient_name} {mail_address}

[Inf|War|Err]

--- Add a not exist recipient

Example

```
HPT CLI> mail recipient add admin admin@somecompany.com Inf War Err
```

This command will setup the RAID system to send mail to admin@somecompany.com about all logged events.

Mail recipient delete {recipient_name}

--- Delete an exist recipient.

Example

```
HPT CLI> mail recipient delete Ferry
```

mail recipient test {recipient_name}

--- Send a testing mail to specified recipient.

Example

```
HPT CLI> mail recipient test RAID
```

mail recipient set {recipient_name} {Inf|War|Err}

--- Set the notification type for a recipient.

Example

```
HPT CLI> mail recipient set admin War Err
```

mail server

--- Print the SMTP server information

Example

```
HPT CLI> mail server
```

Typical output:

```
HPT CLI>mail server
ServerAddress      Port  ssl  Status  Mail From      User Name
-----
secure.emailsrvr.com465  1    Enabled  yzang@highpoint-tech.comyzang@highpoint-tech.com
```

```
mail server set {server_address} {port} {ssl} {status}
                {from_address}
                [username] [password]
```

--- Use this command to configure mail server settings.

{server_address} – SMTP server address

{port} – port, generally 25

{ssl} – used ssl, '1' for enable and port need 465, '0' for disable

{status} – status, 'e' for enable or 'd' for disable

{from_address} – mail from address

{username} – username

{password} – the user's password

Examples:

```
HPT CLI> mail server set secure.emailsrvr.com 465 1 e name@somecompany.com
name@somecompany.com password
```

```
HPT CLI> mail server set mail.somecompany.com 25 0 e admin@somecompany.com
```

mail server set {a|p|s|m|u|t} {value}

--- Use this to separate set your mail server value

Parameters

- a – SMTP server address
- p – port, generally 25
- s – status, ‘e’ for enable or ‘d’ for disable
- m – mail from address
- u – username
- t – user’s password

Examples:

```
HPT CLI> mail server set a smtp.somecompany.com
```

--- Change the server address

```
HPT CLI> mail server set p 25
```

--- Change the port

```
HPT CLI> mail server set s d
```

--- Disable mail notification

```
HPT CLI> mail server set s e
```

--- Enable mail notification

Task Commands

When an array requires regularly verification or rebuilding, you can use the task commands to automate this process in the background. As long as you have the appropriate privileges, you can add new tasks, and modify or delete existing tasks.

Syntax

- task
- task rebuild {array_id} {name=} {once|daily|monthly|weekly}={day} interval={interval} start=mm/dd/yyyy end=mm/dd/yyyy time=hh:mm:ss
- task verify {array_id} {name=} {once|daily|monthly|weekly}={day} interval={interval} start=mm/dd/yyyy end=mm/dd/yyyy time=hh:mm:ss
- task delete {task_id}

- task enable {task_id}
- task disable {task_id}

task

This command displays detailed information about all scheduled tasks.

Example

```
HPT CLI> task
```

This command displays the current background tasks.

```
HPT CLI> task rebuild {array_id} {name=} {once|daily|weekly|monthly}={day} interval={interval}  
start=mm/dd/yyyy end=mm/dd/yyyy time=hh:mm:ss
```

This command allows you to schedule the frequency by once, daily, weekly or monthly and the detailed time range to rebuild a specified array. The first mm/dd/yyyy specifies the task start date, while the second mm/dd/yyyy specifies the task end date.

Note:

When you add a task to rebuild a selected array **once**, the parameter **{day}** should be omitted.

Examples

- HPT CLI> task rebuild 1 name=test once start=10/8/2005 time=12:35:46

This command adds a task schedule named **test** to rebuild the array "1" at 12:35:46 on 10/8/2005. The rebuild frequency is set to **once**.

- HPT CLI> task rebuild 4 name=myraid4 daily=2 start=2/8/2005 end=2/22/2005
time=13:49:58

This command adds a task schedule named **myraid4** to rebuild the array "4" at 13:49:58 every 2 days from 2/8/2005 to 2/22/2005.

- HPT CLI> task rebuild 3 name=myraid3 weekly=2 interval=3 start=2/8/2004
end=2/22/2008 time=13:49:58

This command adds a task schedule named **myraid3** to rebuild the array "3" at 13:49:58 on **Monday** (the 2nd day in a week) every 3 weeks from 2/8/2004 to 2/22/2008.

- HPT CLI> task rebuild 2 name=myraid2 monthly=3 interval=4 start=2/8/2004
end=2/8/2006 time=12:30:33

This command adds a task schedule named **myraid3** to rebuild the array "2" at 12:30:33 on the 3rd day of a month every 4 months from 2/8/2004 to 2/8/2006.

HPT CLI>task verify {array_id} {name=} {once|daily|weekly|monthly}={day} interval={interval} start=mm/dd/yyyy end=mm/dd/yyyy time=hh:mm:ss

This command allows you to schedule a verify task. The usage of this command is the same as adding a rebuild task schedule.

task delete {task_id}

This command allows you to delete a scheduled task. You can query the task ID by `task` command.

Example

```
HPT CLI> task delete 2
```

This command will delete the task "2".

task enable {task_id}

This command will enable a disabled task.

Example

```
HPT CLI> task enable 1
```

This command will enable the disabled task "1".

task disable {task_id}

This command will disable a scheduled task manually.

Example

```
HPT CLI> task disable 1
```

This command will disable the scheduled task"1".

Set Commands

Note: Not all controllers and drivers support this command.

Syntax

- `set [name]={value}`
- `set`

set

Show the system settable parameters.

Typical output:

```
HPT CLI > set
-----
                Show the system setable parameters.
-----
[AR] Auto Rebuild           Disable
[CE] Continue Rebuild On Error Enable
[AA] Audible Alarm          Enable
[RP] Rebuild Priority        Medium
[SD] Spindown Idle Disk <minutes> Disable
[BP] Beeper                 Enable
-----
```

set RP={0-100}

Change rebuilding priority. If controller is not specified, this command will set the global rebuilding priority.

Note:

[0-12]	Lowest
[13-37]	Low
[38-67]	Medium
[68-87]	High
[>88]	Highest

Example

```
HPT CLI> set RP=50
```

set AR={y|n}

- Set enable or disable to the [Auto Rebuild] parameter.

Example

```
HPT CLI> set AR=y
```

set AA={y|n}

- Set enable or disable to the [Audible Alarm] parameter.

Example

```
HPT CLI> set AA=y
```

set SS={y|n}

- Set enable or disable to the [Staggered Spinup] parameter.

Example

HPT CLI> set SS=y

set DS={seconds(1-4)}

- Set the value(1-4) of [Delay between spinup] parameter.

Example

HPT CLI> set DS=2

set CE={y|n}

- Set enable or disable to the [Continue Rebuilding On Error] parameter.

Example

HPT CLI> set CE=y

set BP={y|n}

- Set enable or disable beeper.

Example

HPT CLI> set BP=y

set SD={minutes}

- Set value of [Spindown Idle Disk]

[1-10] 10

[11-20] 20

[21-30] 30

[31-60] 60

[61-120] 120

[121-180] 180

[181-240] 240

Example

HPT CLI> set SD=10

set IT={y|n}

- Set enable or disable to the [INT 13 support] parameter.

Example

```
HPT CLI> set IT=y
```

set {device id} tcq={y|n} ncq={y|n} wc={y|n} ra={y|n} smart={y|n}

- Set parameters of device

The options are:

- tcq={y|n}

Set enable or disable to the tcq parameter.

- ncq={y|n}

Set enable or disable to the ncq parameter.

- wc={y|n}

Set enable or disable to the wc parameter.

- ra={y|n}

Set enable or disable to the ra parameter.

- smart={y|n}

Set enable or disable to the smart parameter.

Example

```
HPT CLI> set 1/2 tcq=y ra=y
```

```
HPT CLI> set 1/2 ncq=n
```

```
HPT CLI> set 1/2 wc=y
```

```
HPT CLI> set 1/2 ra=y
```

Please note that each command allows at most one argument.

set PUIS= {y|n} disks={device id}

- set disk's PUIS feature

Example:

```
HPT CLI> set PUIS=y disks= 1/1,1/2
```

```
HPT CLI> set PUIS=y disks=*
```

set {array id} name={name} cp={wt|wb|none}

The options are:

- {array id}
The array ID.
- name={name}
Set the array name. This is an option to rename an array.
- cp={wt|wb|none}
Set the cache policy of an array.

Example

```
HPT CLI>set 1 name=my_arr
```

```
HPT CLI>set 1 init=y
```

```
HPT CLI>set 1 cp=none
```

Please note that each command allows at most one argument.

Help Commands

Syntax

- help
- help {command}

help

- Show generic help about this utility.

Example

```
HPT CLI> help
```

help {command}

- Show help about a specific command.

Example

```
HPT CLI> help create
```

Exit Command

Syntax

exit

Exit from the interactive mode and close to the window.

Clear Commands

This command is used to clear screen.

Syntax

clear/cls/clr

Appendix A Revision History

Version	Date	Updates
1.0.0	2013/12/20	First release.
1.0.2	2014/08/08	Fix some text errors in file.
1.0.3	2015/01/07	Fix some example mistakes.
1.0.4	2015/01/08	Update Copyright.
1.0.5	2015/01/09	Update task command sample.
1.0.6	2015/01/12	Fix a date mistake.
1.0.7	2015/12/03	Update set command sample.
1.0.8	2019/2/15	Updated smart command sample
1.0.9	2019/4/19	Delete some unsupported functions
1.0.10	2019/07/05	Replaced the location of the Init command and added instructions for creating a RAID
